

From Scheduling to Planning
for complete APS solution

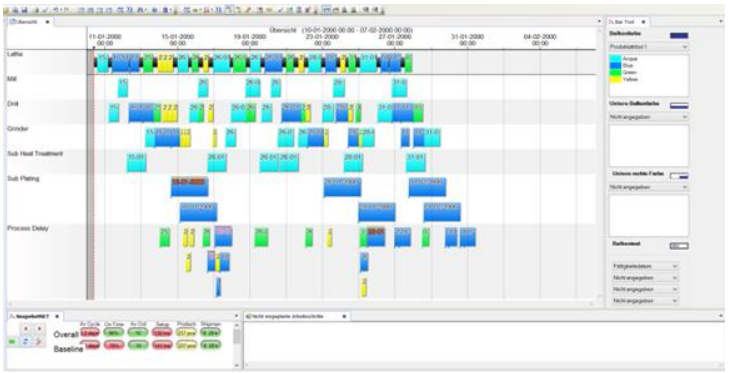
Snapshot – a system of indicators for Preactor

Fulfilment of customer orders. Cost and efficiency management.

Snapshot is an indicator system, which increases the speed of decision-making when planning. Preactor's ability to schedule related operations to limited capacities of resources is supported by an interactive Gantt chart. Snapshot further increases the visibility of changed circumstances and planner interventions in the plan. Snapshot allows you to monitor changes in key indicators of planned production and business efficiency with each change in the schedule of operations. The planner can thus observe the effect of the different rules used and the different interventions - whether they have a positive or negative effect on the schedule of operations.

Snapshot tools

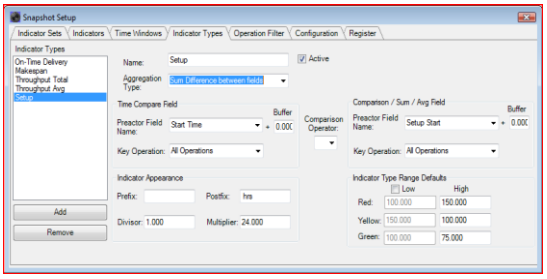
Mike Liddell, whose idea it was, emphasized three criteria during development: usability, simplicity, and flexibility. Thus, three versions of the Snapshot tool were created: Express, Evaluation and Professional.



Snapshot functionalities

- Overall indicator display
- Automatic update of indicators with a change in the schedule of operations
- Circulation between sets of indicators
- Size and display can be displayed in different ways: ovals, hands
- Display of baselines
- Creating your own indicators and types and sets of indicators
- Creating your own time windows
- Adjust the colour of the indicator according to the range of values
- Automatic filtering by Preactor Locator
- Creating operation filters for each indicator
- Import and export the Snapshot configuration

Editing indicator types



Editing time windows
